

Aurora Lane Residence

Application

2,520 square feet of R-Control® Structural Insulated Panels (SIPs) that were used to frame the new Aurora Lane residence.

Project Details

Summer 2005, contractors installed 9 foot, 5-1/2 inch SIP panels on the home and 10 foot, 3-1/2 inch panels on the garage. Gable end panels were easily cut in the field to match the pitch of the roof's truss. The ability to make modifications to the gable end panels simplified the installation of the Structural Insulated Panels.

Structural Insulated Panels (SIPs) have long been used to frame residential and commercial buildings. They speed construction, result in less waste on the jobsite and improve a building's energy efficiency. SIPs are used nationwide in LEED certified projects.
