

Union Pacific Depot

Application

6,000 cubic feet of Foam-Control® EPS 22 Geofoam was installed as floor elevation fill at the Union Pacific Depot in Salt Lake City, Utah.

Project Details

In summer 2006, architects restored the 1908 Union Pacific Depot in Salt Lake City, Utah. The first floor of the depot is no longer used by Amtrak and now serves as an entrance to The Gateway District development.

The three floors of the depot were re-opened with restaurants, retail stores and a concert hall. The Foam-Control® EPS Geofoam was used to create more aesthetically pleasing floor elevations. Geofoam was also used for this project because it is easy to handle and install in areas of the building that were not readily accessible. A four inch thick steel reinforced layer of concrete covers the EPS Geofoam.
