310,000 cubic feet of Foam-Control® EPS15 and EPS22 Geofoam was installed as a green roof and landscape void fill on the rooftop of the Latter-day Saint’s Conference Center in Salt Lake City, Utah.

Summer 2000, landscape architects designed the Latter-day Saints Conference Center to feature a roof top garden complete with planters and trees. 100 truckloads of Foam-Control® Geofoam was used in the project to reduce the volume and weight of concrete and potting soil used in the green roof and planter boxes. The six acre green roof includes a 67’ waterfall.

Foam-Control® Geofoam replaced 150 lbs. per cubic foot of concrete and 50 lbs. per cubic foot of potting soil. In total Geofoam reduced 22 million lbs. of weight on the roof structure.
