59,400 cubic feet of Foam-Control® EPS29 Geofoam was used as hillside road stabilization fill in the Plumas National Forest, in Oroville, California.

**Project Details**

Fall 2007, the US Department of Agriculture’s Forest Service specified Foam-Control® Geofoam for its light weight and high compressive strength. Geofoam ranging from 9’ to 15’ high was installed during roadway repair to stabilize the hillside adjacent to the road where soil erosion and sliding was an ongoing problem.

The United States Forest Service was able to successfully repair the roadway and divert mountain run-off underneath the road through a system of culverts by using Foam-Control® Geofoam to stabilize the hillside.
